Structural reliability, facility safety and product quality are key imperatives which a number of industry sectors must take into account. Non-destructive testing (NDT) techniques can meet these needs by providing information on the “health” of a test piece without having a damaging impact on its later use. The GERIM platform, based on new NDT technology, was inaugurated today at CEA LIST and Saclay in the presence of its founders, CEA, the Ile-de-France region and its R&D partners from industry and academia. Bringing together a broad cross-section of players, it offers advanced support to test and validate future NDT developments.
